We cannot accept responsibility if you choose to do so. The content of this material is directed exclusively at persons who are experienced or existing investors in the products described in this document, who are professional customers as defined by the rules of the Financial Conduct Authority or are otherwise eligible under these rules. It is not intended for retail customers and such persons should not rely on this material. Moreover, any investment or service to which this material may relate, will not be made available to such retail customers. Past performance is no guarantee of future results and the investment objectives of the funds may not be met. Performance data shown represents past performance and current performance may be higher or lower than the performance shown. The investment return and principal value of an investment will fluctuate so that an investor's shares, when redeemed, may be worth more or less than their original cost. To obtain performance data current to the most recent month-end access our website at www.dimensional.com. Average annual total returns include reinvestment of dividends and capital gains.

Dimensional Funds plc and Dimensional Funds II plc are each structured as an umbrella fund with segregated liability between sub-funds, established as an open-end investment company with variable capital and incorporated with limited liability between sub-funds under the laws of Ireland with registration numbers 352043 and 431052 respectively. Dimensional Funds plc and Dimensional Funds II plc qualify and are each authorised in Ireland by the Central Bank of Ireland as an undertaking for collective investment in transferable securities ("UCITS").

Dimensional Funds ICVC is an investment company with variable capital incorporated with limited liability and registered in England and Wales under number IC000258 and authorised by the FCA. The sub-funds are operated separately and the assets of each sub-fund are managed in accordance with the investment objective and policy applicable to that sub-fund.

Dimensional Funds ICVC, Dimensional Funds plc and Dimensional Funds II plc (together the "Dimensional funds") are offered solely under the terms and conditions of the respective fund's current prospectus and applicable Key Investor Information Document ("KIID"). Consider the investment objectives, risks, and charges and expenses of the Dimensional funds carefully before investing. For this and other information about the Dimensional funds, please read the prospectus and KIIDs carefully before investing. The latest version of the prospectus and applicable KIIDs (all in English) may be obtained at www.dimensional.com or by contacting the fund's administrator, or its investment manager at +44 (0)20 3033 3300.

The principal risks of investing in the Dimensional funds may include one or more of the following: market risk, small companies risk, risk of concentrating in the real estate industry, foreign securities and currencies risk, emerging markets risk, banking concentration risk, interest rate risk, risk of investing for inflation protection, risk of municipal securities, and/or fund of funds risk. To more fully understand the risks related to an investment in the funds, investors should carefully read each fund's prospectus and the relevant KIID.

Definitions of Statistical Terms Average Returns (arithmetic mean) is a measure of the "middle performance" of the fund, computed by adding up all the returns and dividing by the number of periods. Standard Deviation measures how different the actual fund returns are from its average performance (see above). The closer the actual returns are to the average, the smaller the standard deviation. Standard deviation is a measure of volatility, generally associated with the risk of investments. Correlation measures the degree to which the performance of two funds moves in tandem, and the direction of their association (one goes up, the other goes up as well – positive correlation). Correlation plays an important part in diversification. Auto-correlation is a specific application of correlation (see above). In this case, the comparison is not between two different funds, but rather returns of the same fund between different periods. For example, an auto-correlation of two periods would show the correlation in returns two periods apart (March-January, April-February, May-March, etc). Covariance measures the trend of common movement in returns between two funds. A positive covariance shows the fund's returns moving in the same direction, whereas a negative covariance shows the funds moving in opposite direction (when one goes up, the other one goes down). Covariance plays a role in determining portfolio volatility. Regression analysis examines the statistical connection between a variable of interest and one or more factors used to explain its variation. For example, if the variable of interest is student test scores, regression could be used to show the connection to factors such as time spent studying or IQ. R-squared is used in regression analysis to determine to what degree the variation in the changing series of interest is explained by the factors used to explain it. R-squared ranges from 0 (no explanatory power), to 1 (virtually all variation is explained by the analysis). In the example above, if test scores is the variable of interest, while IQ and study time are the factors used to explain it, then an R-squared of .9

Standardized Performance Data and Disclosures

As of March, 31, 2016

would indicate that 90% of the variation in test scores can be explained by these two factors. Standard Error is a measure of precision when calculating various statistical terms. Generally, the higher the standard error, the lower the statistical strength of that estimation. T-statistic examines the statistical precision of various estimations by comparing the value of the calculation to the standard error (see above). Generally, a t-stat value of 2 or higher shows enough statistical precision to have confidence in the estimate being different from zero. Turnover is a measure of the fund's trading activity, and loosely represents the portion of a fund's holdings that have changed over a year. A lower turnover ratio indicates a more passive strategy. Tracking Error shows how different are each period's returns of a given fund from the returns of a reference "benchmark" (generally commercial indexes). For example, if fund A's returns in two subsequent periods are 10% and 20%, while the benchmark's returns are 5% and 25% for the same periods, the average is the same (15%), but there is tracking error since there was a difference in period by period returns (period 1: 10% versus 5%, period 2: 20% versus 25%). Alpha measures the difference between the fund's average performance and what would be expected based its compensating risk level, such as beta (see below). For example, if the fund's average return was 10%, but the expectation based on its beta was 9%, then the alpha would show as 1%. Beta measures the degree to which the returns of a fund change with the market movements. Generally, the higher the scale of fund movements (up or down) relative to the market, the greater the beta. This is considered to be compensating risk for investors, i.e. the more risk (higher beta), the higher the investors' expected returns versus the market. Three Factor Model explains the source of performance variation among investment portfolios, and it is an extension of previous Nobel Prize winning work. The model specifies that differences in portfolio returns can be attributed to (1) stocks/fixed income mix – riskier stocks have a higher potential return, (2) market capitalisation of portfolio – smaller capitalisation stocks are riskier and therefore have higher expected returns, and (3) market price relative to accounting measures of the firm, such as book value – stocks with higher book value to market ratios are riskier and have higher expected returns. This model was first published in major academic journals but has gained wide spread acceptance among investment professionals. SMB stands for Small Minus Big, and shows the difference in performance between the returns of small cap stocks and large cap stocks, and it is one of the factors used in the model described above. When used in regression analysis its computed coefficient (s) illustrates to what degree the portfolio captures the returns of small cap or large cap stocks. HML stands for High Book-to-Market(BtM) Minus Low Book-to-Market (BtM), and shows the difference in performance between the stocks with high BtM ratios (value stocks) and stocks with low BtM ratios (growth stocks), and it is one of the factors used in the model described above. When used in regression analysis its computed coefficient (h) illustrates to what degree the portfolio captures the returns value or growth stocks.

Sources and Descriptions of Data

All Dimensional portfolio returns are net of all fees unless otherwise indicated.

All Dimensional trust returns are net of administrative fees only unless otherwise indicated.

Prior to April 2002, certain international equity portfolios charged a reimbursement fee to the purchasers of shares of those portfolios
